fourth international conference on information and communication technology for competitive strategies targets state of the art as well as emerging topics pertaining to information and communication technologies icts and effective strategies for its implementation for engineering and intelligent applications

ICT for Competitive Strategies

2020-05-05

tools and methods from complex systems science can have a considerable impact on the way in which the quantitative assessment of economic and financial issues is approached as discussed in this thesis first it is shown that the self organization of financial markets is a crucial factor in the understanding of their dynamics in fact using an agent based approach it is argued that financial markets stylized facts appear only in the self organized state secondly the thesis points out the potential of so called big data science for financial market modeling investigating how web driven data can yield a picture of market activities it has been found that web query volumes anticipate trade volumes as a third achievement the metrics developed here for country competitiveness and product complexity is groundbreaking in comparison to mainstream theories of economic growth and technological development a key element in assessing the intangible variables determining the success of countries in the present globalized economy is represented by the diversification of the productive basket of countries the comparison between the level of complexity of a country s productive system and economic indicators such as the gdp per capita discloses its hidden growth potential

Complexity in Financial Markets

2013-08-28

this volume constitutes selected papers presented at the third international conference on computing and data science conf cds 2021 held online in august 2021 the 22 full papers 9 short papers presented in this volume were thoroughly reviewed and selected from the 85 qualified submissions they are organized in topical sections on advances in deep learning algorithms in machine learning and statistics advances in natural language processing

Computing and Data Science

leveraging the research efforts of more than sixty experts in the area this book reviews cutting edge practices in machine learning for financial markets instead of seeing machine learning as a new field the authors explore the

connection between knowledge developed by quantitative finance over the past forty years and techniques generated by the current revolution driven by data sciences and artificial intelligence the text is structured around three main areas interactions with investors and asset owners which covers robo advisors and price formation risk intermediation which discusses derivative hedging portfolio construction and machine learning for dynamic optimization and connections with the real economy which explores nowcasting alternative data and ethics of algorithms accessible to a wide audience this invaluable resource will allow practitioners to include machine learning driven techniques in their day to day quantitative practices while students will build intuition and come to appreciate the technical tools and motivation for the theory

Neural Information Processing

discover the power of ai in the crypto world from bitcoin s disruptive emergence to gpt 4 s cutting edge analysis find out how savvy investors conquer the digital currency frontier learn how ai can reshape risk outsmart markets and secure your crypto journey ai insights unravel market trends using gpt 4 s accurate predictions strategy development forge robust strategies leveraging ai s advanced intelligence success stories pitfalls navigate the highs and lows of ai in finance forward thinking roadmap prepare for ai s impact on the future evolution of crypto ai particularly gpt 4 has the potential to revolutionize financial analysis risk assessment and strategic navigation through the complex crypto market from bitcoin s inception to blockchain s role in secure transactions these technologies can redefine traditional banking and fostering investment opportunities there are ai driven applications for smarter investing enhanced risk management and efficient smart contract development available now but it is important to be aware of their limitations and to choose with care the gpt 4 crypto revolution provides a contemporary roadmap of ai involvement in crypto detailing emerging trends and regulatory landscapes amid digital transformation capitalize on the crypto boom and sidestep many of the pitfalls with the strategic intelligence ai can provide start trading smarter today

Proceedings of International Conference on Innovations in Software Architecture and Computational Systems

2024-02-26

volume 1 of the strategic analysis of financial markets framework is premised on the belief that markets can be understood only by dropping the assumptions of rationality and efficient markets in their extreme forms and showing that markets still have an inherent order and inherent logic but that order results primarily from the predictable irrationality of investors as well as from people s uncoordinated attempts to profit the market patterns that result do not rely on rationality or efficiency a framework is developed for understanding financial markets using a combination of psychology statistics game and gambling analysis market history and the author s experience it expresses analytically how professional investors and traders think about markets as games in which other participants employ inferior partially predictable strategies those strategies interactions can be toxic and lead to booms bubbles busts and crashes or can be less dramatic leading to various patterns that are mistakenly called market inefficiencies and stylized facts a logical case is constructed starting from two foundations the psychology of human decision making and the fundamental laws of gambling applying the fundamental laws to trading leads to the idea of gambling rationality grationality replacing the efficient market s concept of rationality by classifying things that are likely to have semi predictable price impacts price distorters one can identify explore through data analysis and create winning trading ideas and systems a structured way of doing all this is proposed the six step strategic analysis of market method examples are given in this and volume 2 volume 2 of the strategic analysis of financial markets trading system analytics continues the development of volume 1 by introducing tools and techniques for developing trading systems and by illustrating them using real markets the difference between these two volumes and the rest of the literature is its rigor it describes trading as a form of gambling that when properly executed is quite logical and is well known to professional gamblers and analytical traders but even those elites might be surprised at the extent to which quantitative methods have been justified and applied including a life cycle theory of trading systems apart from a few sections that develop background material volume 2 creates from scratch a trading system for eurodollar futures using principles of the strategic analysis of markets method samm a principled step by step approach to developing profitable trading systems it has an entire chapter on mechanical methods for testing and improvement of trading systems which transcends the rather unstructured and unsatisfactory backtesting literature it presents a breakout trend following system developed using factor models it also presents a specific pairs trading system and discusses its life cycle from an early highly profitable period to its eventual demise recent developments in momentum trading and suggestions on improvements are also discussed

The GPT-4 Crypto Revolution

2017-03-24

the 4 volume set lnai 13935 13938 constitutes the proceedings of the 27th pacific asia conference on knowledge discovery and data mining pakdd 2023 which took place in osaka japan during may 25 28 2023 the 143 papers presented in these proceedings were carefully reviewed and selected from 813 submissions they deal with new ideas original research results and practical development experiences from all kdd related areas including data mining data warehousing machine learning artificial intelligence databases statistics knowledge engineering big data technologies and foundations

Artificial Intelligence, Blockchain, Computing and Security Volume 1

2023-06-23

michael c münnix analyses the statistical dependencies in financial markets and develops mathematical models using concepts and methods from physics the author focuses on aspects that played a key role in the emergence of the recent financial crisis estimation of credit risk dynamics of statistical dependencies and correlations on small time scales he visualizes the findings for various large scale empirical studies of market data the results give novel insights into the mechanisms of financial markets and allow conclusions on how to reduce financial risk significantly

Multi-disciplinary Trends in Artificial Intelligence

2011-07-29

future politics confronts one of the most important questions of our time how will digital technology transform politics and society the great political debate of the last century was about how much of our collective life should be determined by the state and what should be left to the market and civil society in the future the question will be how far our lives should be directed and controlled by powerful digital systems and on what terms jamie susskind argues that rapid and relentless innovation in a range of technologies from artificial intelligence to virtual reality will transform the way we live together calling for a fundamental change in the way we think about politics he describes a world in which certain technologies and platforms and those who control them come to hold great power over us some will gather data about our lives causing us to avoid conduct perceived as shameful sinful or wrong others will filter our perception of the world choosing what we know shaping what we think affecting how we feel and guiding how we act still others will force us to behave certain ways like self driving cars that refuse to drive over the speed limit those who control these technologies usually big tech firms and the state will increasingly control us they will set the limits of our liberty decreeing what we may do and what is forbidden their algorithms will resolve vital questions of social justice allocating social goods and sorting us into hierarchies of status and esteem they will decide the future of democracy causing it to flourish or decay a groundbreaking work of political analysis future politics challenges readers to rethink what it means to be free or equal what it means to have power or property what it means for a political system to be just or democratic and proposes ways in which we can and must regain control

2023-11-03

this proceedings volume contains papers accepted by the 2nd international conference on business and policy studies conf bps 2023 which are carefully selected and reviewed by professional reviewers from corresponding research fields and the editorial team of the conference this volume presents the latest research achievements inspirations and applications in applied economy finance enterprise management public administration and policy studies conf bps 2023 was a hybrid conference that includes several workshops offline and online around the world in cardiff jan 2023 london feb 2023 and sydney feb 2023 prof canh thien dang from king s college london prof arman eshraghi from cardiff business school and prof kristle romero cortés from unsw business school have chaired those offline workshop

Advances in Computational Intelligence

2023-10-07

this text presents a modern theory of analysis control and optimization for dynamic networks mathematical techniques of lyapunov drift and lyapunov optimization are developed and shown to enable constrained optimization of time averages in general stochastic systems the focus is on communication and queueing systems including wireless networks with time varying channels mobility and randomly arriving traffic a simple drift plus penalty framework is used to optimize time averages such as throughput throughput utility power and distortion explicit performance delay tradeoffs are provided to illustrate the cost of approaching optimality this theory is also applicable to problems in operations research and economics where energy efficient and profit maximizing decisions must be made without knowing the future topics in the text include the following queue stability theory backpressure max weight and virtual queue methods primal dual methods for non convex stochastic utility maximization universal scheduling theory for arbitrary sample paths approximate and randomized scheduling theory optimization of renewal systems and markov decision systems detailed examples and numerous problem set questions are provided to reinforce the main concepts table of contents introduction introduction to queues dynamic scheduling example optimizing time averages optimizing functions of time averages approximate scheduling optimization of renewal systems conclusions

Proceedings of the 2nd International Conference on Business and Policy Studies

2022-05-31

this book provides the latest viewpoints of scientific research in the field of e business it is organized into three sections higher education and digital economy development artificial intelligence in e business and business intelligence applications chapters focus on china s higher education in e commerce digital economy development natural language processing applications in business information technology governance risk and compliance it grc business intelligence and more

Stochastic Network Optimization with Application to Communication and Queueing Systems

2021-05-19

economic modeling using artificial intelligence methods examines the application of artificial intelligence methods to model economic data traditionally economic modeling has been modeled in the linear domain where the principles of superposition are valid the application of artificial intelligence for economic modeling allows for a flexible multi order non linear modeling in addition game theory has largely been applied in economic modeling however the inherent limitation of game theory when dealing with many player games encourages the use of multi agent systems for modeling economic phenomena the artificial intelligence techniques used to model economic data include multi layer perceptron neural networks radial basis functions support vector machines rough sets genetic algorithm particle swarm optimization simulated annealing multi agent system incremental learning fuzzy networks signal processing techniques are explored to analyze economic data and these techniques are the time domain methods time frequency domain methods and fractals dimension approaches interesting economic problems such as causality versus correlation simulating the stock market modeling and controling inflation option pricing modeling economic growth as well as portfolio optimization are examined the relationship between economic dependency and interstate conflict is explored and knowledge on how economics is useful to foster peace and vice versa is investigated economic modeling using artificial intelligence methods deals with the issue of causality in the non linear domain and applies the automatic relevance determination the evidence framework bayesian approach and granger causality to understand causality and correlation economic modeling using artificial intelligence methods makes an important contribution to the area of econometrics and is a valuable source of reference for graduate students researchers and financial practitioners
