this book arose from courses taught by the authors and is designed for both instructional and reference use during and after a first course in algebraic topology it is a handbook for users who want to calculate but whose main interests are in applications using the current literature rather than in developing the theory typical areas of applications are differential geometry and theoretical physics we start gently with numerous pictures to illustrate the fundamental ideas and constructions in homotopy theory that are needed in later chapters we show how to calculate homotopy groups homology groups and cohomology rings of most of the major theories exact homotopy sequences of fibrations some important spectral sequences and all the obstructions that we can compute from these our approach is to mix illustrative examples with those proofs that actually develop transferable calculational aids we give extensive appendices with notes on background material extensive tables of data and a thorough index audience graduate students and professionals in mathematics and physics

a cutting edge new vision of biology that will revise our concept of what life itself is how to enhance it and what possibilities it offers biology is undergoing a quiet but profound transformation several aspects of the standard picture of how life works the idea of the genome as a blueprint of genes as instructions for building an organism of proteins as precisely tailored molecular machines of cells as entities with fixed identities and more have been exposed as incomplete misleading or wrong in how life works philip ball explores the new biology revealing life to be a far richer more ingenious affair than we had guessed ball explains that there is no unique place to look for an answer to this question life is a system of many levels genes proteins cells tissues and body modules such as the immune system and the nervous system each with its own rules and principles how life works explains how these levels operate interface and work together most of the time with this knowledge come new possibilities today we can redesign and reconfigure living systems tissues and organisms we can reprogram cells for instance to carry out new tasks and grow into structures not seen in the natural world as we discover the conditions that dictate the forms into which cells organize

themselves our ability to guide and select the outcomes becomes ever more extraordinary some researchers believe that ultimately we will be able to regenerate limbs and organs and perhaps even create new life forms that evolution has never imagined incorporating the latest research and insights how life works is a sweeping journey into this new frontier of the life sciences a realm that will reshape our understanding of life as we know it
