circuits for submicron cmos vlsi ming dou ker senior member ieee abstract a whole chip esd protection design with efficient vdd to vss esd clamp circuits is proposed to provide a real whole chip esd protection for submicron cmos ic s without causing unexpected esd damage in the internal circuits the

design of flip flops for high performance vlsi applications Nov 16 2022

for submicron cmos technology area topology selection power dissipation and speed are very important aspect especially for designing clocked storage element cse for high speed and low energy design like portable batteries and microprocessors various classes of flip flops have been projected to achieve high speed and low energy operation

radiation tolerant vlsi circuits in standard deep submicron Oct 16 2022

the authors discuss design issues related to the extensive use of enclosed layout transistors elts and guard rings in deep submicron cmos technologies in order to improve radiation tolerance of asic s designed for the lhc experiments the large hadron collider at present under construction at cern

improved breakdown voltage complementary mosfet in a 0 18 μ m Sep 14 2022

a novel higher breakdown voltage cmos shows the lowest foms among the same voltage rate devices good enough for high frequency and low power applications finally novel improved bv devices are integrated as power switches with vlsi low voltage cmos for smps applications
