Proceedings, Second Working Conference on Reverse Engineering 2008-09-22 searching for semantics data mining reverse engineering stefano spaccapietra fred m aryanski swiss federal institute of technology university of connecticut lausanne switzerland storrs ct usa review and future directions in the last few years database semantics research has turned sharply from a highly theoretical domain to one with more focus on practical aspects the ds 7 working conference held in october 1997 in leysin switzerland demon strated the more pragmatic orientation of the current generation of leading researchers the papers presented at the meeting emphasized the two major areas the discovery of semantics and semantic data modeling the work in the latter category indicates that although object oriented database management systems have emerged as commercially viable prod ucts many fundamental modeling issues require further investigation today s object oriented systems provide the capability to describe complex objects and include techniques for mapping from a relational database to objects however we must further explore the expression of information regarding the dimensions of time and space semantic models possess the richness to describe systems containing spatial and temporal data the challenge of in corporating these features in a manner that promotes efficient manipulation by the subject specialist still requires extensive development

Model Driven Engineering Languages and Systems 2010-11-22 computer systems play an important role in our society software drives those systems massive investments of time and resources are made in developing and implementing these systems maintenance is inevitable it is hard and costly considerable resources are required to keep the systems active and dependable we cannot maintain software unless maintainability characters are built into the products and processes there is an urgent need to reinforce software development practices based on quality and reliability principles though maintenance is a mini development lifecycle it has its own problems maintenance issues need corresponding tools and techniques to address them software professionals are key players in maintenance while development is an art and science maintenance is a craft we need to develop maintenance personnel to master this craft technology impact is very high in systems world today we can no longer conduct business in the way we did before that calls for reengineering systems and software even reengineered software needs maintenance soon after its implementation we have to take business knowledge procedures and data into the newly reengineered world software maintenance people can play an important role in this migration process software technology is moving into global and distributed networking environments client server systems and object orientation are on their way massively parallel processing systems and networking resources are changing database services into corporate data warehouses software engineering environments rapid application development tools are changing the way we used to develop and maintain software software maintenance is moving from code maintenance to design maintenance even onto specification maintenance modifications today are made at specification level regenating the software components testing and integrating them with the system eventually software maintenance has to manage the evolution and evolutionary characteristics of software systems software professionals have to maintain not only the software but the momentum of change in systems and software in this study we observe various issues tools and techniques and the emerging trends in software technology with particular reference to maintenance we are not searching for specific solutions we are identifying issues and finding ways to manage them live with them and control their negative impact
